

The Decline of Diesel (Motorin) Sales in Turkey — 2026 Analysis Report

Prepared: 23 July 2026 Scope: Turkish road-fuel market, with focus on diesel demand for a fuel distribution company Primary sources: EPDK petroleum-market sector reports, TÜİK (Turkish Statistical Institute), PETDER, ODMD/ODD, TAİD, IEA — figures triangulated via multiple press reports of the official bulletins where direct access was restricted. See Sources and Data Caveats.

1. Executive Summary

Turkey’s diesel (motorin) sales have rolled over in 2026 after a record 2025. Cumulative January–May 2026 diesel sales are down roughly **–3% year-on-year (~9.9 Mt vs ~10.2 Mt)**, but the decline is accelerating sharply: **April –4.1%, May –15.7% y/y** — while gasoline sales keep growing at double digits (**+~10% Jan–May 2026**). This is a *diesel-specific* decline, not a general fuel-demand collapse.

The decline is best understood as **three stacked layers**:

1. **An acute 2026 shock** — the Iran war and Strait of Hormuz disruption from late February 2026 produced the largest supply disruption in oil-market history (IEA), hitting middle distillates hardest. Turkish pump diesel briefly exceeded **80 TL/L in March 2026** and is back above **74–75 TL/L in July** despite state tax support. Regional trade and the Iran/Iraq trucking corridors were disrupted, and Turkish hauliers lost corridor share to Iranian-plated trucks that refuel with subsidized Iranian diesel.
2. **A cyclical layer** — the orthodox disinflation program (policy rate 37%, three straight holds citing the war) is cooling exactly the diesel-intensive sectors: industry contracted **–0.8% in Q1 2026**, exports slumped, and agriculture — after farm GDP fell **–8.8% in 2025** on drought and frost — cut planted area, reducing tractor fuel use.
3. **A structural layer** — the end of dieselization. Diesel’s share of new passenger-car sales collapsed from **~62% in 2015 to 6.2% in H1 2026** (historic low). Hybrids + EVs took **>51% of new-car sales in 2026** for the first time. The diesel car park share peaked at **38.3% in 2020** and is down to **32.1% (June 2026)**, eroding ~1.5 pp/year. This layer guarantees the decline does not fully reverse even if prices normalize.

Key forward risk: the eşel-mobil ÖTV support that cushioned pump prices during the war steps down to 25% in August–September and **ends entirely on 1 October 2026**, implying a further pump-price step-up and renewed demand pressure in Q4 2026.

Brand-level finding (Section 7): Shell is underperforming the market, and the underperformance is concentrated in diesel. Shell slipped from a comfortable #2 (19.7% in 2023) to trading places with Opet around #2/#3, while Petrol Ofisi pulled ~6 points ahead by absorbing BP’s ~770 stations. Shell’s diesel share (~17–19%) runs well below its all-products share because its book is skewed to premium retail/passenger diesel — the collapsing segment — while PO dominates the resilient contracted fleet/wholesale channel and Opet enjoys a Tüpraş/Koç supply advantage in a year when supply shifted decisively from imports to domestic refining.

2. What the Official Data Shows

2.1 Annual diesel sales (EPDK)

Year	Motorin sales	YoY	Note
2022	24.54 Mt	–1.6%	EPDK annual report
2023	~26.1 Mt	~+6%	derived; strong growth year
2024	~26.1 Mt	~0–1%	flat (PETDER: ~31.7M m³, +0.1%)
2025	27.08 Mt	+3.7%	record; flattered by discounted Russian-origin diesel and tax-suppressed prices

2025 was a three-year record for the whole fuel market (34.49 Mt total, +5.3%), with diesel ~78% of the barrel. The 2026 decline therefore comes off a high base.

2.2 Monthly 2026 — the turn (EPDK monthly reports)

Month 2026	Motorin	YoY	Benzin	YoY
January	1,861,387 t	−1.7%	428,812 t	+9.1%
February	1,834,490 t	+1.1%	417,803 t	+17.7%
March	2,260,390 t	+8.1%*	480,187 t	+8.1%
April	2,004,871 t	−4.1%	466,449 t	+6.1%
May	1,960,637 t	−15.7%	521,965 t	+11.4%

* March's jump reflects panic/stock buying ahead of war-driven price increases plus Ramadan-holiday timing; the underlying trend resumes in April-May. The May print also includes a high May-2025 base effect — the underlying cumulative trend is ~−3% with accelerating Q2 weakness.

Corroborating signals: - **Diesel-type imports collapsed every month of 2026** (Feb −30.9%, Apr −26.2%, May −27.0%) while crude imports rose — refineries substituted for imported product, and distributors bought less overall. - May 2026 total petroleum sales fell −10.5% y/y; diesel was the entire drag. - Refinery diesel *production* also fell (Feb −9.7%) while total output rose — refiners are pivoting yields toward gasoline and jet (jet exports +33.7% y/y in May).

2.3 The gasoline-diesel crossover

Gasoline has nearly **doubled since 2022** (3.30 Mt → 5.69 Mt in 2025, +16.4% in 2025 alone) while diesel grew only ~10% over the same span. The benzin:motorin ratio moved from ~1:7.4 (2022) to ~1:4.3 (early 2026). Every month of 2026 shows the same pattern: **gasoline up, diesel down/flat**. Hybrids burn gasoline — the fleet transition (Section 3) directly feeds this divergence.

2.4 LPG (otogaz) — also in structural decline

2025 LPG sales: 3.95 Mt, **−4.7%** (otogaz −4.8%). LPG's share of the car park fell from 6.7% of conversions-era peaks to ~1.0% of new sales; the parc share dropped from 36.7% (2020) to 29.4% (June 2026). Both legacy alternative fuels — diesel and LPG — are losing to gasoline-hybrid and electric.

3. Vehicle Park and Sales Mix by Fuel Type (the demand base)

3.1 Registered fleet — stock (TÜİK, end-June 2026)

Total registered vehicles: **34,545,132** (+6.7% y/y).

Vehicle type	Share	Approx. count	Fuel relevance
Car (otomobil)	51.7%	17,867,368	mixed (see below)
Motorcycle	21.5%	~7.43M	gasoline
Kamyonet (van/pickup)	14.4%	~4.97M	~all diesel
Tractor	6.8%	~2.35M	diesel
Kamyon (truck)	3.1%	~1.07M	diesel
Minibus	1.6%	~0.55M	mostly diesel
Bus	0.6%	~0.21M	diesel

Car fleet by fuel (June 2026): diesel 32.1% (~5.74M), gasoline 31.0%, LPG 29.4%, hybrid 4.7% (~847k), BEV 2.5% (~446k).

Diesel share of the car park — the multi-year slide:

Year-end	Diesel share of cars
2020	38.3% (peak)
2022	36.9%
2024	34.1%
2025	32.6%
Jun 2026	32.1%

The erosion is accelerating (~1.5 pp/year now vs ~0.7 pp/year in 2020–22). The diesel car stock is ageing and shrinking by attrition, because almost no diesel cars enter the fleet anymore:

3.2 New passenger-car sales by fuel — flow (ODMD)

Fuel	2023	2024	2025	H1 2026
Gasoline	66.8%	~60%	47.0%	~42%
Hybrid	10.8%	18.8%	27.2%	~32%
Electric (BEV)	7.5%	10.7%	17.7%	18.5%
Diesel	13.8%	9.8%	7.4%	6.2% (historic low)
LPG	1.1%	~0.5%	0.7%	~0.6%

For historical contrast: diesel was **61.7% of new car sales in 2015**. Diesel car unit sales fell –32.7% y/y in Jan–Apr 2026. In 2026 hybrids+EVs passed 50% of new-car sales for the first time (51.2–51.6% H1). BEV park passed 450,000 by mid-2026 (from 373,733 at end-2025); public charge points reached 45,660 (from ~12,000 at start-2024), with H1 2026 charging energy +153% y/y.

The overall market is also contracting: after three record years (2023–2025, peaking at 1,368,400 car+LCV in 2025), **H1 2026 sales fell –8.2% y/y** (June alone –11.4%).

3.3 Commercial vehicles — the core of motorin demand

Passenger cars are a minority of diesel consumption; trucks, vans, buses and tractors dominate. There: - **Light commercial (LCV/kamyonet)**: record 283,904 units in 2025 (+10%), but **H1 2026 –1.7%**, and June 2026 alone **–15.5% y/y** — “commercial slammed the brakes” (Dünya). The segment remains effectively all-diesel, so LCV sales are a leading indicator for motorin. - **Heavy commercial (TAİD)**: 38,957 units in 2025 (tractor-units –6%); **Q1 2026 a “controlled contraction.”** The heavy fleet isn’t shrinking, but new investment is soft — consistent with weak freight activity.

Implication: passenger-segment diesel demand is in structural decline; total motorin demand is increasingly a pure freight + agriculture play — and both of those are weak in 2026 for cyclical reasons.

4. Why Diesel Is Falling — The Drivers, Ranked

Layer 1 — Acute: the 2026 Iran war fuel-price shock (*strong evidence; explains the timing and depth*)

- The US-Israel-Iran war from late February 2026 and the Strait of Hormuz disruption (~20% of world oil trade) caused what the IEA calls the **largest supply disruption in oil-market history**. Brent rose ~65% in March (to ~\$109–110/bbl); global Q2 supply fell ~6.9 mb/d y/y.
- The shock was **diesel-skewed**: Gulf export refineries offline plus middle-distillate stocks near 20-year lows pushed diesel cracks far above gasoline. European diesel hit ~€2.08/L (+30%).
- Turkish pump transmission**: diesel briefly >80 TL/L in March; after the 17 June de-escalation it fell to ~64.7 TL/L, then renewed strikes and July hikes (+8.5 TL cumulative in July) took it back above 74–75 TL/L.
- IEA now forecasts the **first annual decline in world oil demand since 2020** — Turkey’s diesel drop has a global demand-destruction backdrop.
- The sales data match the timeline exactly: pre-buying in March (+8.1%), then –4.1% April, –15.7% May.

Layer 2 — Cyclical: macro cooling and freight weakness (*strong evidence on facts; entangled with Layer 1*)

- Tight money**: policy rate 37%, with TCMB pausing cuts for three straight meetings (Mar–Jun 2026) explicitly citing the war’s inflation risk. Q1 2026 GDP +2.5% (below consensus), with **industry contracting –0.8%** while household consumption (+4.8%) did the lifting — precisely the mix that lifts gasoline and depresses diesel.
- Freight/corridors**: Jan–May 2026 Turkish-plated truck runs to Iran fell –17% on exports and **–48% on imports**, while Iranian-plated runs grew — every shifted trip is diesel bunkered in Iran (heavily subsidized), not bought in Turkey. Border waits reached 28 days; exporters reported ~\$815M of regional export losses in a single war month; war-risk premiums tripled sea-freight rates.
- Agriculture**: farm GDP –8.8% in 2025; first-harvest wheat yields –40–50% on drought/frost; ~900,000 dekar of farmland damaged by disasters in H1 2026 (TZOB); reduced planting = fewer tractor-hours. Agriculture is roughly low-teens % of diesel use.

Layer 3 — Structural: the end of dieselization (*strong evidence; slow but irreversible*)

- Diesel lost its historical pump-price advantage: diesel now prices **~4–5 TL/L above gasoline** (74–75 vs ~70 TL/L, July 2026) — a complete reversal of the relationship that built Turkey’s diesel car park. The lower ÖTV on diesel is now fully offset by diesel’s higher ex-refinery cost (“Turkey’s diesel tax buffer evaporates” — bne IntelliNews).

- Automakers are dropping diesel variants; Euro 7 pressure; municipalities discussing old-diesel restrictions; only 53% of Turkish consumers prefer ICE for their next car (Deloitte 2026).
- Mirrored Europe-wide: EU diesel-car share of new sales fell ~49% → ~9% in a decade; EU oil demand –270 kb/d in 2025.
- Rail: 2026 declared “railway year,” rail freight share targeted 6.76% → 7.53% — marginal near-term diesel displacement.

Secondary / monitoring items (*partial or speculative*)

- **Illegal fuel (“10 numara yağ”):** major June 2026 operation put 10 fuel companies under TMSF trusteeship; İstanbul seized 242,500 L in Q1 alone. Two-way effect: crackdowns raise recorded volumes, but 75–80 TL/L diesel raises the incentive for untaxed fuel, which would depress *recorded* sales. Unquantified — monitor.
- **Supply-side reshuffle:** US sanctions on Rosneft/Lukoil (Nov 2025) + EU ban on fuels from Russian crude (Jan 2026) removed the discounted Russian diesel that flattered 2025 volumes and raised feedstock costs. Note: Tüpraş’s *domestic diesel sales rose +20% y/y in Q1 2026* — it is taking share from imports even as total demand falls. Distributor-level declines and refinery-level gains coexist; don’t confuse the signals.
- **Biodiesel/ethanol blending:** small volume effects (~0.5% obligation); gasoline ethanol actually cut 2% → 1.5% for 2026.

5. “What Else Can It Be?” — Checklist for Your Analysis

You asked what to analyze beyond the fleet’s fuel/vehicle distribution. Based on this research, a complete diagnostic for a distributor should cover:

1. **Fleet fuel mix (stock + flow)** — TÜİK park data *and* ODMD new-sales mix (Section 3). The flow matters more than the stock for the trend.
2. **Fuel volumes by product** — EPDK monthly sector reports (motorin vs benzin vs otagaz), plus the import/production split.
3. **Relative pump prices** — the diesel-vs-gasoline gap and the *real* (inflation-adjusted) diesel price to hauliers/farmers; ÖTV indexation (Jan/July) and eşel-mobil timeline.
4. **Freight activity** — UND corridor statistics (especially Iran/Iraq), KGM ton-km and traffic counts, export volumes (TİM), container/sea-freight rates. Diesel is a freight fuel first.
5. **Macro cycle** — industrial production, construction activity, GDP composition (consumption vs industry), TCMB rate path.
6. **Agriculture** — planted area, drought/frost damage (TZOB), mazot support payments.
7. **Substitution technologies** — hybrid/EV sales and charging-network throughput (EPDK: H1 2026 charging energy +153% y/y), rail freight share.
8. **Base effects** — 2025 was a record year inflated by cheap Russian-origin diesel and suppressed prices; y/y comparisons in 2026 are against a high base.
9. **Illegal/untaxed fuel intensity** — correlates with real price peaks; distorts *recorded* sales.
10. **Your own channel mix** — a distributor’s decline can be market share loss to refinery-direct sales (Tüpraş domestic diesel +20% in Q1 2026), not just market contraction. Separate the two.

6. Outlook and Implications for a Fuel Distributor

- **Q3-Q4 2026:** eşel-mobil support steps down (25% Aug-Sep) and **ends 1 October 2026**; when international prices fall, ÖTV is raised to recapture the decline. Either way, pump diesel stays high → continued demand pressure. Renewed Iran-related supply risk keeps distillate cracks elevated.
- **Structural floor:** even after prices normalize, the fleet math is one-way. Diesel car inflow ≈ 6% of sales vs a 32% park share means the passenger diesel park shrinks for years. Expect passenger-related motorin demand to decline a few percent per year regardless of the cycle.
- **Where diesel demand lives now:** kamyon/kamyonet/bus/tractor. Track LCV and heavy-truck sales (both contracting in 2026) and freight corridors as your leading indicators.
- **Where growth lives:** gasoline (+16% in 2025, +10% in 2026 YTD) — driven by hybrids — and electric charging (sessions +97%, energy +153% y/y). Station-network product mix, hybrid-friendly forecourt strategy, and charging infrastructure are the offsets to a shrinking diesel barrel.
- **Scenario framing for 2026 full year:** if June–December runs at April–May’s pace (–4% to –16%), full-year 2026 motorin could land roughly **–4% to –7% below 2025** (~25.2–26.0 Mt vs 27.08 Mt) — worse if the eşel-mobil exit bites in Q4, better if the war de-escalates durably. Treat as a planning range, not a forecast.

7. Competitive Analysis — Why Shell Is Underperforming the Market

The market contraction (Sections 2–4) explains the industry trend, but not brand divergence. EPDK distributor-level data shows Shell is losing *relative* position, and the loss is concentrated in diesel.

7.1 Market shares by distributor (EPDK, total white products)

Distributor	2023 (FY)	2024 (FY)	Mar/Apr 2026 (monthly)	May 2026 (monthly)
Petrol Ofisi (Vitol)	21.90% — #1	21.43% (excl. BP)	26.34% (incl. ex-BP)	26.36%
Shell (Shell & Türcas)	19.71% — #2	~19.4% (–0.3 pt; lost #2 rank)	19.49% — #3	20.43% — #2 (by 0.02 pt)
Opet (Koç/Tüpraş)	18.93% — #3	~20.4% (+0.7 pt, biggest gainer)	19.69% — #2	20.41% — #3

Shell held a comfortable #2 in 2023; by 2024 Opet overtook it, and in 2026 the two oscillate within 0.1 pt of each other while Petrol Ofisi has pulled ~6 points ahead. In Q1 2025 the sector’s retail volume grew +8% y/y while Opet grew +12% — the only top-3 brand gaining share that quarter.

7.2 The diesel-specific gap — Shell’s core weakness

EPDK monthly product-level data (spring 2026): Petrol Ofisi sold ~606k t of motorin vs Opet ~410k t and **Shell ~370k t** — implying diesel shares of roughly **PO 27–31%, Opet 18–21%, Shell 17–19%**. Two structural facts:

- **Shell’s diesel share runs 1.5–3 points below its all-products share; PO’s runs above its own.** Shell is #1 in *gasoline* nationally; PO is #1 in *diesel*, with the entrenched commercial/wholesale franchise (193 wholesale dealers, ~1.0M m³ storage across 11 terminals, AutoMatic/Filo fleet cards, Border Pass tax-free diesel for international hauliers).
- In 2024 Shell’s diesel volume fell ~1% while Opet grew diesel ~7% (Deniz Yatırım sector summary — verify against the report PDF).

So when the *diesel* market contracts 4–16% per month (2026), the brand most exposed to spot/retail passenger diesel — rather than contracted fleet volume — loses fastest. Diesel is ~4x the gasoline market by tonnage, so diesel weakness dominates total volumes even though Shell’s gasoline franchise is growing.

7.3 The explanations, ranked by evidence

1. Rivals bulked up while Shell stayed the same size — the arithmetic driver (strong). Petrol Ofisi’s acquisition of BP Türkiye (~770 stations; approved Sep 2024, legally merged 28 Feb 2025, rebranding to finish by 1 Nov 2026) took PO’s network to ~2,700 sites and its share from 21.4% to ~26.4% — and PO has so far *retained* essentially all of BP’s book inside one loyalty/fleet ecosystem. Opet is expanding aggressively (1,882 → 1,966 stations incl. Sunpet; publicly targeting market leadership within three years; fastest-growing brand of Q1 2025). Shell & Türcas’ network actually *grew* (1,146 → 1,202 → ~1,250 sites, 2023–2025) — this is not station attrition — but ~1,250 sites now compete against a 2,700-station PO and a ~1,950-station Opet, plus a merged Alpet+TP (~1,073 sites, #4). Shell’s own headline metric — throughput per station 2.14x the sector average — is the mirror image of a scale disadvantage.

2. Channel and product mix: overweight premium retail gasoline, underweight fleet diesel (strong). Shell & Türcas’ own disclosures confirm it: its *station-channel* share (~20.8–21.8% “under-canopy”) is **higher** than its all-channel share (~19.5–20.4%), meaning Shell is structurally light in the wholesale/commercial channel where the diesel volume war is fought. The collapsing segment — passenger diesel — is where Shell’s retail-skewed diesel book sits; the resilient segment — contracted freight fleets — is where PO dominates via fleet cards and wholesale relationships. Notably, Shell’s *total* May 2026 share held up (20.43%) precisely because gasoline (+11% y/y) is booming and Shell leads it — the gasoline boom masks the diesel loss in the totals.

3. Supply economics reshuffled against import-dependent players (strong structurally; Shell-specific exposure partly inferred). ~85% of Turkey’s 13.6 Mt diesel imports in 2025 were Russian-origin barrels bought at a discount. Shell plc exited Russian hydrocarbons in 2022, so Shell Türkiye plausibly never rode that discount — while trader-backed rivals could (inference; company-level import origins are not public). Then sanctions (Rosneft/Lukoil Nov 2025, EU import ban Jan 2026, Russia’s own diesel-export ban extended into 2026–27) killed the imported-barrel game for everyone and shifted supply to Tüpraş — whose domestic diesel sales rose +20% y/y in Q1 2026 at 95% utilization. The natural winners of that shift: **Opet (Tüpraş owns ~41.7% of it, same Koç group, plus Ditaş tanker fleet)** and **PO (Vitol trading muscle, largest terminal network ~1.0M m³ vs Shell’s ~255k m³ at Marmara Ereğlisi)**. During the supply squeeze, terminal-owning importers prioritized their own dealer networks.

4. Parent-strategy divergence: Shell harvests value while rivals’ owners buy share (partial). Shell plc’s global “value over volume” doctrine — divesting ~500 company-owned stations/year in 2024–25, exiting fuel retail in some national markets, pivoting capex to EV charging — contrasts with Vitol, Koç and Zeren, all in expansion mode in Turkey. The concrete Turkish datapoint: in 2026 Shell agreed to transfer its airport aviation-fuel JV stakes (Antalya, Bodrum, İzmir) to **THY Opet**, exiting a

business held since 2008. No evidence of a Turkish retail exit — the JV network is dealer-owned and growing — but STAS reporting emphasizes per-station profitability and dividends, not volume growth, which is consistent with deliberately ceding the volume war.

5. The discount/loyalty war (partial). Domestic discount brands (Aytemiz, Alpet/TP, Güzel Enerji, Moil, Kadoil) have been eroding the big distributors' combined share (~9 points over recent years), and 75-80 TL/L diesel accelerates price-sensitive migration. PO runs mass Positive-point campaigns valid across PO and ex-BP stations; Opet stacks bank-card deals and high-profile advertising. Shell's ClubSmart offers are comparable in kind but not obviously in intensity. Pump prices are near-uniform under EPDK oversight, so the fight is via campaign depth, fleet-card terms and dealer economics — including reported aggressive poaching of well-located dealers at 5-year contract renewals (anecdotal).

Ruled out: the June 2026 illegal-fuel crackdown (BADAY/BDY Group, 10 companies to TMSF trusteeship) was an LPG-sector operation among small distributors — not a factor in Shell-vs-PO/Opet diesel divergence.

7.4 What this means for Shell's diesel numbers

Putting Sections 2-4 and 7 together: Shell's diesel decline $\approx$ (market -3% and accelerating) $\times$ (a diesel book skewed to the fastest-shrinking segment) + (share leakage to a consolidated PO and an expanding, supply-advantaged Opet). In other words, roughly half the story is the market and half is competitive position — and the competitive half is concentrated in **fleet/commercial diesel**, not in the forecourt network, which is growing and out-earning the sector per site.

7.5 Levers worth analyzing internally

- 1. Fleet/commercial channel push** — Shell's under-canopy share exceeds its all-channel share; the gap is the commercial channel. Benchmark fleet-card terms against PO AutoMatic/Filo Club and Opet's Koç-group corporate access; consider a border-corridor product answering PO's Border Pass (ÖTV/KDV-free transit diesel).
- 2. Supply contracts** — quantify Shell Türkiye's import vs Tüpraş-purchase mix and its landed-cost gap vs Opet/PO since Jan 2026; renegotiate domestic offtake while Tüpraş runs at 95%+ utilization.
- 3. Dealer renewals defense** — map the 5-year contract expiry calendar in freight-corridor locations against rival signing-bonus activity.
- 4. Double down where the market is coming to Shell** — gasoline/hybrid premium (V-Power) and EV charging (Shell Recharge/Eşarj partnership) are the growing segments and match Shell's existing franchise strengths.
- 5. Decompose your own decline** — split station-channel vs commercial-channel volume loss, and same-station diesel volumes vs network effects, to confirm how much is market vs share within your own data.

8. B2C Deep-Dive: Did Retail Diesel Shift to B2B, or to Competitors? — A Data Guide

For a B2C (forecourt) analyst, the decline decomposes into three possible destinations for lost liters, each requiring different data:

Destination	Mechanism	Detectable with public data?
(a) Demand destruction	Passenger diesel park shrinking (hybrid/EV shift), price elasticity at 75-80 TL/L, less driving	Yes — Sections 2-4 (TÜİK fleet, EPDK volumes)
(b) B2C → B2B channel migration	Same liters, different channel: businesses moving pump purchases onto fleet cards/TTS, corporates centralizing supply, UTTS formalization	Only partially — channel data is sector-level, not per company
(c) Loss to competitor forecourts	PO/Opet loyalty ecosystems, ex-BP conversions, dealer poaching, discount-brand migration	Partially — brand shares are national; no company $\times$ province data

8.1 What EPDK publishes — and the two critical gaps

Available: - **Province-level volumes (the strongest public dataset):** every EPDK monthly sector report carries annex “**Ek-1 İller Bazında Petrol Ürünü Teslimleri**” — motorin/benzin deliveries for all 81 provinces, monthly, current through May 2026. This is your geographic demand baseline. - **Company-level national sales and shares:** monthly distributor league tables (basis of Section 7). - **Channel split at sector level only:** istasyonlu bayi (station dealers), istasyonsuz bayi, serbest kullanıcı (licensed large consumers $\geq 5,000$ t/yr buying direct), and ihrakiye are reported as aggregates. The Rekabet Kurumu sector report tabulates serbest-kullanıcı motorin deliveries 2016-2022. - **Station license registry (lisans sorgulama):** every bayilik license with address (il/ilçe) and the distributor it's tied to — a full district-level station census by brand is buildable, and the periodic license-action lists (new/amended/terminated, including **dağıtıcı-change amendments**) let you track dealer switching between brands over time. Third-party trackers (enerjilisans.com, petrolpiyasasi.com) compile these movements. - **Province/district pump prices:** bildirim.epdk.gov.tr price bulletins — local price-competition context.

Not public (the two gaps that block a direct answer): 1. **Company $\times$ channel:** no distributor-level retail-vs-commercial split is published (Shell's own retail vs fleet volumes are visible only internally). EPDK collects it via the bildirim system but treats it as commercially confidential. 2. **Company $\times$ province:** EPDK publishes only the two marginals — company totals nationally, and all-

company totals per province. The cross-matrix is confidential. TTS/fleet-card volumes (PO AutoMatic, Shell Filo, Opet TTS) are unpublished; UTTS rollout figures appear only as press milestones.

8.2 Is there a B2C→B2B shift? What the sector-level evidence says

Three sector-level signals suggest a real (but probably secondary) channel migration on top of the demand story:

- **UTTS (Ulusal Taşıt Tanıma Sistemi):** since 2024–25, vehicles claiming fuel tax deductions must carry Darphane’s UTTS units (~8M taxpayers expense fuel; installation deadlines ran to mid-2025). This structurally pushes business fuel purchases that used to look like anonymous B2C pump sales onto identified fleet/TTS rails — a *reclassification* of B2C liters as B2B, without any liter leaving the market. If your B2C series excludes TTS transactions, UTTS alone would depress measured B2C volume in 2025–26.
- **Fleet-card economics in a price-shock year:** at 75–80 TL/L, SMEs and tradespeople have maximum incentive to formalize fuel into deductible, discounted fleet programs — and PO’s AutoMatic/Positive ecosystem (now spanning ex-BP sites too) is the biggest gravity well.
- **The surviving diesel demand is B2B by nature:** passenger (B2C) diesel is the structurally dying segment (park share 38.3%→32.1%; new-car share ~6%), while freight/fleet diesel merely cycles. So even with zero switching, the *mix* of remaining diesel shifts toward B2B every quarter.

Against this: Shell’s station-channel share (~21–21.8%) *exceeds* its all-channel share — Shell’s problem is not its forecourt franchise, which out-earns the sector per site, but the small size of its commercial channel. For a Shell B2C analyst this cuts two ways: your channel is Shell’s strongest, and your diesel decline is likely dominated by (a) demand destruction plus (b) reclassification into fleet rails — with (c) competitor loss concentrated in specific corridors and ex-BP catchments rather than nationwide.

8.3 A practical triangulation method (public + internal data)

1. **Build the geographic baseline:** EPDK Ek-1 province × month motorin series, 2023–2026. Compute each province’s decline vs the national –3%. Provinces with outsized declines (border/freight provinces — Van, Hakkari, Ağrı, Şırnak, Gaziantep — or drought-hit agricultural provinces) flag *market* effects; provinces where the market held but your volume fell flag *share* effects.
2. **Overlay your own station-level B2C sales** (internal) on the same province grid: your share of each province ≈ your volume ÷ Ek-1 total. Where your share fell, check the license registry for competitor station openings/brand conversions (especially **ex-BP→PO conversions, >460 completed by mid-2026**) within the same ilçe — that isolates destination (c).
3. **Test the channel-migration hypothesis internally:** plot your own B2C pump diesel against your own (and sector) fleet/TTS diesel by month. A mirror image (B2C down, TTS up, sum flat) = migration; both down = demand destruction. Segment B2C customers who *stopped* buying: did their loyalty IDs reappear on Shell fleet cards (internal migration — not a loss at all) or vanish (churn)?
4. **Demand controls:** TÜİK province-level vehicle stock by fuel type (il × yakıt tables in the Motorlu Kara Taşıtları annexes) to normalize for local diesel-park shrinkage; KGM annual traffic counts (AADT + heavy-vehicle share per road section) for corridor traffic; TCMB/EVDS weekly card-spending “akaryakıt” series — note that falling card fuel spend against stable EPDK volumes is itself a B2B-shift signal, since TTS postpaid volumes bypass card rails.
5. **What only a data request can answer:** the company × channel and company × province cells. Options: an EPDK bilgi edinme (information) request for anonymized channel aggregates; PETDER member data (company × product, national); or commissioning the registry-scrape + Ek-1 model above as the best public approximation.

Bottom line: the precise question — “did Shell’s B2C diesel go to B2B or to competitors, district by district” — is not answerable from public data alone, because both critical cross-tabs are confidential. But the triangulation above (public province volumes + license registry + your internal channel and loyalty data) can attribute the decline to the three destinations with reasonable confidence, and your internal fleet-card and loyalty-ID data is the single most decisive input.

9. Data Caveats

1. Direct access to data.tuik.gov.tr, epdk.gov.tr, petder.org.tr and odmd.org.tr PDFs was blocked in this research environment; official-bulletin figures were triangulated across ≥2 independent press reports each. **Verify key figures against the primary PDFs before external use:** EPDK *Petrol Piyasası Aylık Sektör Raporu*, EPDK annual reports, TÜİK *Motorlu Kara Taşıtları* bulletins, ODMD monthly press bulletins, PETDER sector reports.
2. 2021/2023/2024 diesel tonnages marked “derived” are back-calculated from EPDK YoY percentages.
3. Jan–May 2026 cumulative totals are sums of monthly EPDK prints, not an official cumulative figure.
4. PETDER reports volumes in m³ (diesel ~0.83 t/m³), EPDK in tonnes — never mix bases.

5. ODMD fuel-type splits cover passenger cars only; the LCV segment is effectively all-diesel but not broken out.
6. June 2026 EPDK data was not yet published at compile time (~7-week lag).
7. Distributor market shares (Section 7) come from press reports of EPDK monthly tables; the month attribution of the ~606k/410k/370k t diesel volume split varies between reports (March vs May 2026) — the ranking and relative gaps are consistent, but pull the exact table from the EPDK monthly PDF before quoting. One-off outlier figures (“PO 34.9%”, “Shell & Turcas 31.5%”) circulating in secondary summaries are inconsistent with all other sources and were discarded.
8. Company-level fuel import origins (who bought Russian-origin barrels 2023-25) are not published by EPDK; the Shell supply-cost inference in 7.3 is flagged as such. Consider an EPDK information request or PETDER annual tables.
