

# Why Shell Türkiye’s B2C Share Hit an All-Time High in the May 2026 EPDK Report

*Prepared: 27 July 2026 Scope: Shell & Turcas Petrol A.Ş. (STAŞ) retail (B2C / istasyon) market share in Türkiye, based on the EPDK Petrol Piyasası May 2026 monthly sector report (published ~20 July 2026) and the preceding monthly reports. Method note: direct access to epdk.gov.tr and several sector sites was blocked in this research environment; figures were triangulated across multiple independent press reports of the official bulletins. Verify key numbers against the EPDK PDF before external use.*

## 1. Executive Summary — the one-paragraph answer

Shell’s record B2C share in May 2026 is **not primarily a “Shell did something new in May” story — it is a “the market came to Shell” story, amplified by real Shell execution and competitor disarray**. May 2026 was the most gasoline-skewed, most retail-skewed month in the modern Turkish fuel record: gasoline sales rose **+11.4% y/y (521,965 t)** while diesel collapsed **–15.7% (1,960,637 t)**, a record nine-day Kurban Bayramı (23–31 May) produced all-time road-travel records and **827 million litres** of pump sales in ten days, and pump prices were *falling* into the holiday. Shell is Türkiye’s **#1 gasoline seller (~30% of national benzin)** with the **highest-throughput station network in the sector (~2.1–2.5× sales per station vs average)** — exactly the profile that gains when the demand mix swings from commercial diesel to holiday gasoline. On top of that mechanical mix effect, three competitors were structurally impaired during the data month (TP Petrol Dağıtım’s dealer network in regulatory free-agency, Balpet delicensed, Petrol Ofisi mid-way through digesting 770 ex-BP stations), and Shell’s own commercial engine (fastest dealer recruitment, loyalty and fill-up campaigns, premium V-Power positioning, top customer-satisfaction scores) converted the traffic into share. Roughly, we estimate **+0.5–1.0 pp of the gain is mix-mechanical** and the rest is genuine within-product share capture. Part of the record is therefore **seasonal/one-off (bayram, TP window)** and will partially revert in June–July data; part is **structural (hybrid-driven gasoline growth, diesel decline, competitor consolidation)** and should keep Shell’s B2C share on a rising trend.

## 2. What the May 2026 EPDK report actually shows (market level)

| Metric (May 2026)                | Value                 | y/y            |
|----------------------------------|-----------------------|----------------|
| Benzin (gasoline) domestic sales | 521,965 t             | <b>+11.43%</b> |
| Motorin (diesel) domestic sales  | 1,960,637 t           | <b>–15.73%</b> |
| Total petroleum product sales    | 2,625,231 t           | –10.49%        |
| Diesel-type imports              | 845,903 t             | –27.0%         |
| LPG / otogaz                     | 336,830 t / 288,624 t | +1.4% / +4.5%  |

Two derived facts matter more than any single number:

- Gasoline’s weight in the white-product barrel jumped from ~16.8% (May 2025) to ~21.0% (May 2026)** — a +4.2 pp mix swing in a single year, by far the most gasoline-heavy month in the data. (Implied May 2025 base: benzin ~468k t, motorin ~2,327k t.)

2. **The decline was concentrated in diesel/B2B, not in retail.** Benzin is sold almost entirely through station pumps (~99.5% per EPDK channel data), while roughly a quarter-plus of motorin goes to B2B channels (serbest kullanıcı, commercial/fleet, wholesale). A -15.7% diesel month with industry contracting (Q1 2026 industrial GDP -0.8%), freight corridors disrupted by the Iran war, and agriculture weak is above all a **B2B demand collapse**. The B2C pool held up far better — and in bayram week actually boomed.

Month-by-month trend into May (EPDK monthlies):

| 2026 | Benzin    | y/y    | Motorin     | y/y    |
|------|-----------|--------|-------------|--------|
| Jan  | 428,812 t | +9.1%  | 1,861,387 t | -1.7%  |
| Feb  | 417,803 t | +17.7% | 1,834,490 t | +1.1%  |
| Mar  | 480,187 t | +8.1%  | 2,260,390 t | +8.1%* |
| Apr  | 466,449 t | +6.1%  | 2,004,871 t | -4.1%  |
| May  | 521,965 t | +11.4% | 1,960,637 t | -15.7% |

\* March’s diesel increase is a stockpiling + base-effect artifact, not holiday demand: fleets and drivers pre-bought ahead of war-driven price hikes (arefe day 19 March saw 87.5M L of diesel sold — a normal *working-day* volume on a holiday eve), and the comparison base, March 2025, was itself depressed because the 9-day Ramazan 2025 holiday began on 29 March. See Appendix A.

Every month of 2026 repeats the same signature — gasoline up, diesel flat-to-down — and May is the extreme print of the series. **Whoever leads gasoline retail leads May.** That is Shell.

3. Shell’s position going into May

Shell’s product mix is uniquely gasoline- and retail-tilted among the majors:

| Latest public data             | Shell                                         | Rank | Leaders                      |
|--------------------------------|-----------------------------------------------|------|------------------------------|
| Benzin, Mar 2026               | 143,051 t ≈ <b>29.8% of national gasoline</b> | #1   | Opet 131,032 t; PO 115,826 t |
| Benzin, Apr 2026               | ~140.7M litres/month                          | #1   | —                            |
| Motorin, Mar 2026              | 370,000 t ≈ 16.7%                             | #3   | PO 606,300 t; Opet 409,900 t |
| Total white products, Apr 2026 | <b>19.49%</b>                                 | #3   | PO 26.34%; Opet 19.69%       |

Benchmark share history (to validate “highest of all time”):

| Period              | Shell share | Basis                                                                   |
|---------------------|-------------|-------------------------------------------------------------------------|
| 2023 (annual)       | 19.71%      | total fuel, #2 (a <i>declining</i> year for Shell per EPDK 2023 report) |
| 2024 (annual)       | ~20.1%      | retail station sales, sector leader claim                               |
| Dec 2024 / Oct 2025 | ~21.5%      | “canopy” (station B2B+B2C) share, self-reported leader                  |
| May 2025 (monthly)  | ~18.8–19.8% | total white products, #3                                                |
| Apr 2026 (monthly)  | 19.49%      | total white products, #3                                                |

So Shell’s pre-May retail-share ceiling was roughly **20–21.5%**. Nothing in the record contradicts a May 2026 all-time high; every documented driver points to it. Note that no press outlet had republished the May distributor table as of 27 July — the record figure you are looking at exists (for now) only in the EPDK PDF and internal reads of it.

**The network math:** Shell runs ~1,250 stations vs Petrol Ofisi’s ~2,700 and Opet’s ~1,800, yet holds ~30% of gasoline — because its per-station throughput is ~2.1–2.5× the sector average, its network over-indexes on metropolitan and intercity-corridor sites, and it has been the sector’s fastest dealer recruiter (+50 new dealers since Nov 2023). This is precisely the network shape that captures holiday highway traffic.

#### 4. The five drivers of the May record, ranked

##### Driver 1 — The gasoline/diesel mix shock (mechanical; largest single factor)

Shell’s B2C share is a weighted average of its ~30% gasoline share and its (much lower) ~17–20% retail-diesel share. When gasoline’s weight in the retail barrel jumps, Shell’s blended share rises **with Shell doing nothing at all**.

**Why this lifts Shell and not “any company”:** share is zero-sum, and mix rewards portfolio asymmetry. A distributor’s blended share = its diesel share +  $w \times (\text{gasoline share} - \text{diesel share})$ , where  $w$  is gasoline’s weight in the barrel. The gasoline-minus-diesel share gap by major (March 2026 product shares):

| Distributor  | Benzin share | Motorin share | Gap      | Effect of $w$ rising 16.8% → 21.0% |
|--------------|--------------|---------------|----------|------------------------------------|
| Shell        | 29.8%        | 16.4%         | +13.4 pp | ≈ +0.57 pp blended share           |
| Opet         | 27.3%        | 18.1%         | +9.2 pp  | ≈ +0.39 pp                         |
| Petrol Ofisi | 24.1%        | 26.8%         | −2.7 pp  | ≈ −0.11 pp                         |

Same market, same volumes — Shell gains the most, Opet gains less, and the market leader *loses* share, purely because Shell’s portfolio is by far the most gasoline-asymmetric of any major. During the bayram window itself  $w$  hit 33%, implying a Shell blended share of ~20.8% for those ten days vs ~18.6% at last year’s mix. And the collapsing segment (B2B/commercial diesel) is where Petrol Ofisi leads, while the booming segment (holiday retail gasoline) is where Shell leads — the mix shock was, in effect, a transfer from PO’s book to Shell’s.

Illustrative bridge (assumptions stated, verify against the PDF): applying EPDK channel weights (benzin ~99.5% via stations, motorin ~73%), gasoline’s weight in the *retail* barrel rose from ~21.6% (May 2025) to ~26.7% (May 2026). Holding Shell’s product-level shares constant at ~30% (benzin) and ~19% (retail motorin), the blended retail share moves from ~21.4% to ~21.9% — ≈ **+0.5–0.6 pp of B2C share from mix alone**, before any actual share capture. The same arithmetic on total white products gives ~+0.5 pp (19.0% → ~19.5%). Any print meaningfully above that (e.g. 22%+) implies Shell *also* gained within products — see Drivers 2–5.

This driver is structural, not one-off: hybrids (847k cars, 4.7% of the parc, all burning gasoline) plus a gasoline car parc that grew from 3.2M (2020) to 5.55M (Jun 2026) guarantee gasoline keeps outgrowing diesel. Diesel is 6–8% of new-car sales; hybrid+EV passed 51%. **The mix tailwind blows in Shell’s favor every month from here — May just blew hardest.**

##### Driver 2 — A record nine-day Kurban Bayramı sat almost entirely inside May (seasonal; the amplifier)

- Holiday window **23–31 May 2026** (arefe 26 May, bayram 27–30 May, plus 1.5 days administrative leave) — a nine-day national holiday, fully inside the May data month.
- All-time mobility records: **29.3M vehicles** through tolled highways/bridges; 18.5M on KGM highways; Yavuz Sultan Selim Bridge's highest single day ever (189,004 vehicles, 22 May); record European border-gate crossings on 30 May.
- **827,272,614 litres** of gasoline+diesel sold in 22–31 May (₺54.1bn). During the holiday window the national sales mix shifted to **~33% gasoline vs ~20% on a normal day**.
- Holiday demand is almost purely **B2C passenger-car, highway-corridor, big-brand demand** — while B2B diesel demand (freight, industry, agriculture) simultaneously cratered. The retail channel's weight in the whole market surged, and within retail, the segments where Shell over-indexes (intercity corridors, premium V-Power, loyalty-carrying urban customers) surged most.
- Pricing helped rather than hurt: diesel was cut **5.52 TL/L on 9 May**, a further gasoline cut landed on bayram eve, and eşel-mobil ÖTV support (up to 13.90 TL/L diesel / 10.59 TL/L gasoline waived) kept pump prices ~64–67 TL/L — falling prices into a holiday maximize discretionary travel.
- **Quantified:** during the 22–31 May window, daily gasoline ran ~27.5M L/day vs a ~20.9M normal (**+32%**) while daily diesel ran ~55.2M L/day vs ~85.9M normal (**–36%**). Spread over the month, and against a May 2025 base that contained *zero* holiday days (Kurban 2025 fell 6–9 June), the holiday calendar alone plausibly contributed **~+8–9 pp of gasoline's +11.4%** and **–6 to –10 pp of diesel's –15.7%**. The underlying, calendar-clean trends are roughly benzin +3–5% and motorin –6 to –9% — i.e., the May mix shift that lifted Shell was largely a calendar event layered on a real but smaller structural shift. Historical validation of this holiday signature is in **Appendix A**.

### Driver 3 — Competitor disruption (a *level* driver, not the May spike)

**Timing caveat, stated plainly:** the TP and BP events were already fully reflected in April's numbers — TP's dealer free-agency opened in November 2025, BP's dealers moved under PO's license from 1 March, Balpet was delicensed in February 2025. They therefore explain why Shell's 2026 share *level* sits above its 2024–25 range (i.e., why an all-time high was within reach at all), and they depress the May 2025 *base* in y/y comparisons (TP alone still held ~4.9% of the market in May 2025). But they cannot explain the May-over-April jump — that increment is Drivers 1–2. The only genuinely May-relevant pieces here are the tail of TP dealer migration (the EPDK transfer window ran to 30 June, so switching continued through April–May) and ongoing BP → PO rebranding churn.

- **TP Petrol Dağıtım (Türkiye Petrolleri, ~4.9% share / ~592 dealers a year earlier):** criminal investigation over an 18,476-tonne fuel shortfall (>₺1bn), executives jailed. EPDK board decisions 13916 (3 Nov 2025) and 14415 (26 Mar 2026) allowed TP dealers to **temporarily sell under other distributors' licenses until 30 June 2026** — no exit fees. Through the entire May data month, a ~5%-share network was in free agency and its volumes were being booked under rival flags. Which majors captured how much is not public; given Shell's recruitment record, some accrual to Shell is likely, and even PO/Opet-bound volume mechanically lifts every remaining player's share as TP's own line collapses.
- **Balpet:** distributor license canceled 13 Feb 2025 (smuggling-law court ruling) — another mid-tier network's volume permanently redistributed into 2025–26 comparisons.
- **Petrol Ofisi mid-BP-integration:** PO absorbed BP's 770 stations (dealers under PO's license from 1 March; 460+ rebranded; completion due 1 Nov 2026) and has said it will shed overlapping sites. Rebranding churn of this scale historically leaks fuel volume and dealers at the margin; ex-BP premium-brand customers are a natural V-Power/Shell audience. (Direct evidence of ex-BP dealers moving to Shell was **not** found — treat as plausible, unproven.)

- Background: the intensifying illegal-fuel crackdown (242,500 L seized in İstanbul in Q1 alone; the 23 June TMSF mega-operation came just after the May window) squeezes the untaxed fringe that competes hardest against branded retail in diesel.

#### Driver 4 — Shell’s own commercial engine (real, but the constant, not the delta)

- Fastest dealer recruiter in the sector (+50 dealers since Nov 2023); network ~1,250 stations and growing; sales per station ~2.1–2.5× sector average.
- Active spring 2026 retail stimulation: ClubSmart fill-up campaigns (chip-para/Juzdan promos, ₺350-back mechanics), the V-Power raffle, ClubSmart×CarrefourSA grocery-to-fuel points, İş Bankası Maximum and Akbank Axess co-campaigns — all engineered to concentrate fill-ups at Shell, precisely the behavior that peaks in a holiday month. (The “Shell’de Boş Yok” ≥₺1,250-fill campaign format launched 29 May in its 2025 edition; a 2026 rerun is unconfirmed.)
- Premium mix: V-Power pricing power and Türkiye’s top sector customer-satisfaction scores (KalDer) — brand preference matters most for on-highway holiday fill-ups by one-off customers.
- Organizational continuity: new CEO Oğuz Uçanlar (from 1 Jan 2026) inherited the strategy of outgoing CEO Emre Turanlı — whose promotion to run Shell’s *global* licensed-markets mobility business is itself a signal of how the Türkiye retail unit was performing.

#### Driver 5 — B2B weakness flattered the B2C ratio (definitional)

If the metric you track is B2C share *of Shell’s or the market’s total*, note that May’s –15.7% diesel print was driven by B2B demand destruction (industry, freight corridors –17/–48% to Iran, agriculture). A collapsing B2B denominator raises any B2C ratio. Check which definition your report uses before comparing across months: Shell’s share **of the retail market** (most likely, and what this report analyzes) vs the B2C **portion of Shell’s own volume** (which would rise on B2B weakness alone).

### 5. How much of the record is repeatable?

| Component                            | Est. contribution         | Durability                                                                                                                |
|--------------------------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Gasoline/diesel mix shift            | ~+0.5–1.0 pp vs year-ago  | <b>Structural</b> — hybrid fleet keeps growing; diesel in secular decline                                                 |
| Bayram retail surge + falling prices | material within-May boost | <b>One-off</b> — reverts in June data (no holiday; post-holiday lull)                                                     |
| TP free-agency window                | unquantified, positive    | <b>Partially reverts</b> — dealers auto-revert to TP on 1 July 2026 unless they formally switched; watch June/July tables |
| BP → PO churn                        | small, positive           | Plays out through 1 Nov 2026 rebrand deadline                                                                             |
| Shell campaigns/network              | steady accrual            | Durable while sustained                                                                                                   |

**Expect the June 2026 print (due ~late August) to come off the May peak** — June 2026 has no holiday while the June 2025 base contained the (short, 4.5-day) Kurban 2025 holiday, so the calendar flips *against* gasoline/retail; add the post-holiday demand lull, freight catch-up lifting diesel, and the TP window closing. The right internal read is: **trend B2C share = structurally rising; May level = trend + ~1–2 pp of perfect-storm**. The bigger risk to H2 retail volumes is the scheduled end of eşel-mobil ÖTV support on **1 October 2026** — a pump-price step-up that will hit discretionary (B2C gasoline) demand first, even as it may further squeeze marginal competitors.

---

## 6. What to verify in the primary PDF / internally

---

1. The exact May 2026 distributor table (total, benzin, motorin) — no press outlet had republished it by 27 July; this analysis reconstructs drivers, not the printed figure.
2. Shell’s benzin share in May specifically — if it exceeded ~30%, within-product capture was real, not just mix.
3. Whether your B2C series is “share of retail channel” or “B2C portion of Shell volume” (Section 4, Driver 5).
4. Dealer-count movements Mar–Jun 2026: how many ex-TP (and any ex-BP/Balpet) sites flagged to Shell — this determines how much of the gain survives 1 July.
5. One press pass reported alternative y/y figures for May (benzin +4.4%, motorin –2.0%) against the same tonnages; the +11.43/–15.73 set is multi-source and arithmetically consistent, but confirm against the PDF.

**Four falsifiable checks against the May table you hold** (each discriminates between the mix mechanism and genuine within-product capture):

1. **Opet up, PO down?** If the mix mechanism dominates, Opet’s share should also have risen (about two-thirds of Shell’s gain, per the gap ratio 9.2/13.4) and Petrol Ofisi’s should have fallen. If instead only Shell rose, something Shell-specific did the work.
2. **Shell’s May benzin share vs March’s 29.8%.** Above ~30% → Shell captured share *within* gasoline (holiday-corridor/brand/campaign effect is real). Flat ~29–30% → the record is mix + channel arithmetic.
3. **Shell’s gain vs Opet’s gain, ratio-adjusted.** If Shell gained meaningfully more than 1.45× Opet’s gain, the excess is within-product capture, not portfolio shape.
4. **The B2B (serbest kullanicı) table.** If the diesel collapse concentrated in PO/Opet’s commercial books while station-channel diesel held up better, the B2C-vs-B2B channel effect is confirmed independently of gasoline.

---

## Appendix A — The holiday effect on gasoline vs diesel: historical validation

---

**Question addressed:** diesel *rose* in March 2026 (+8.1%), which was a bayram month, yet *fell* in May 2026 (–15.7%), also a bayram month — so is the “holiday effect” real? Answer: yes, but the holiday effect on **diesel is negative**, always. Long holidays boost gasoline (passenger travel) and suppress diesel (freight, industry and agriculture idle). March’s diesel increase came from two other forces: panic stockpiling ahead of war-driven price hikes, and a depressed base month. The evidence:

### A.1 What actually happens to daily sales inside holiday windows (EPDK bayram data)

| Holiday window                             | Days | Daily benzin | vs month-normal | Daily motorin | vs month-normal |
|--------------------------------------------|------|--------------|-----------------|---------------|-----------------|
| Ramazan 2024 (5–14 Apr, 9-day holiday)     | 10   | 19.7M L      | ≈ +11%          | 51.8M L       | ≈ –40%          |
| Kurban 2024 (15–22 Jun, 9-day holiday)     | 8    | 23.2M L      | ≈ +10%          | 59.2M L       | ≈ –35%          |
| Ramazan 2025 (28 Mar–6 Apr, 9-day holiday) | 10   | 21.3M L      | ≈ +9%           | 53.7M L       | ≈ –35%          |
| Ramazan 2026 (14–22 Mar)                   | 9    | 23.1M L      | ≈ +11%          | 57.6M L       | ≈ –33%          |

| Holiday window                                | Days | Daily benzin   | vs month-normal | Daily motorin | vs month-normal |
|-----------------------------------------------|------|----------------|-----------------|---------------|-----------------|
| <b>Kurban 2026 (22–31 May, 9-day holiday)</b> | 10   | <b>27.5M L</b> | <b>≈ +32%</b>   | 55.2M L       | <b>≈ –36%</b>   |

(Normals ≈ same-month EPDK volumes ÷ days; ~20.9M L/day benzin and ~85.9M L/day motorin were the figures cited in the 2026 coverage.)

**In every observed holiday window since 2024, daily diesel ran 33–40% below normal while daily gasoline ran above normal.** The holiday has never lifted diesel — freight bans on major corridors during bayram peak days (İçişleri Bakanlığı circulars; fuel tankers exempt, general freight not), factory working-day losses (May 2026 industrial production –2.9% m/m, the sharpest fall since April 2025, explicitly attributed to the 9-day bayram), and idle agriculture guarantee it. Kurban 2026’s gasoline surge (+32% daily) was by far the strongest on record — the all-time mobility records did that.

## A.2 The monthly signature in the EPDK series, 2023–2026

| Bayram month                                         | Holiday      | Benzin y/y    | Motorin y/y   | Motorin level vs prior month |
|------------------------------------------------------|--------------|---------------|---------------|------------------------------|

\* Measured against a base month that itself contained a bayram, which flatters the diesel y/y.

The pattern holds every time: in bayram months gasoline’s y/y jumps far above its trend while diesel prints below trend or negative. Note Mar 2025: diesel fell **–3.7%** in a year when full-year diesel *grew* +3.7% — losing just the last ~3 days of March to the holiday start was enough to turn the month negative.

## A.3 Why March 2026 diesel rose +8.1% anyway (three forces, none of them “holiday demand”)

- 1. Panic stockpiling ahead of price hikes.** The Iran war began late February; pump prices were rising almost daily through March. Fleets, farmers and drivers topped off tanks and depots. The proof is in the holiday window itself: arefe day 19 March 2026 saw **87.5M litres of diesel** sold — *above* the normal working-day average of 85.9M, on a holiday eve — and the Ramazan 2026 window’s 57.6M L/day diesel average was the highest of any holiday window in three years. People weren’t burning that diesel on holiday trips; they were storing it before the next price hike.
- 2. A depressed base.** March 2025 (the y/y comparison base, 2,090,251 t, itself –3.7%) lost its final ~3 days to the start of the 9-day Ramazan 2025 holiday. A weak base flatters March 2026 by roughly +3 pp.
- 3. Window placement.** The Ramazan 2026 window (14–22 Mar) sat mid-month, so both the pre-holiday loading rush *and* the post-holiday freight catch-up (23–31 Mar) landed inside the same month, roughly

netting out the holiday drag. Kurban 2026 (22–31 May) sat at month-end: May absorbed the full holiday suppression while the catch-up spilled into June.

**The historical precedent for stockpiling months:** July 2023, when a large mid-month ÖTV hike triggered pre-buying, printed motorin **+24.7%** y/y — and July 2024, against that inflated base, printed **–11.9%**. Price-shock months produce diesel spikes with paybacks later; March 2026 (+8.1%) followed by April (–4.1%) and May (–15.7%) fits that template exactly, amplified by the holiday calendar.

#### A.4 What this means for the Shell B2C reading

- The May gasoline/diesel divergence (+27 pp spread) is precisely what 9-day holidays have always produced — but May 2026 stacked it on top of a genuine, accelerating diesel decline and measured it against a holiday-free May 2025. The holiday explains roughly **+8–9 pp of benzin's +11.4%** and **–6 to –10 pp of motorin's –15.7%**.
- Correspondingly, of Shell's record B2C share, the mix-mechanical component is **majority calendar-driven for May specifically** — reinforcing the expectation that the June print mean-reverts (June 2026 has no holiday; the June 2025 base has a short one; freight catch-up lifts diesel).
- The *structural* mix tailwind (hybrid-driven gasoline growth ~+5%/yr trend vs diesel ~–5%/yr trend ex-calendar) remains intact and continues to favor Shell — just at a gentler slope than the raw May print suggests.
